Scenario 1: Hotel Room Reservation

Process description

A guest books a room through the hotel's online reservation system. The process starts when the guest submits a room booking request along with check-in and check-out dates. The reservation system checks room availability for the requested dates. If no rooms are available, the guest is notified immediately and the process ends. If rooms are available, the system requests an advance payment (deposit) from the guest. If the payment is successful, the system confirms the booking, generates a booking reference number, and sends a booking confirmation email with the reservation details. If the payment fails, the guest is notified of the payment failure and the process ends.

Elements used

1 Start Event: Guest submits booking request (check-in/out dates).

- Check Room Availability.
- Request Payment (Deposit).
- Confirm Booking & Generate Reference No.
- Send Booking Confirmation Email.
- Notify Guest: No Rooms Available.
- Notify Guest: Payment Failed.

2 Exclusive Gateways: Rooms Available? | Payment Successful?

3 End Events: No Rooms Available, Payment Failed, Booking Confirmed.

Each End Event represents one possible outcome of the reservation process.

Gateway logic

- **Rooms Available?** — Yes: the guest is asked for a deposit payment. No: a no-rooms-available notification is sent and the process ends.
- **Payment Successful?** — Yes: the booking is confirmed, a reference number is generated, and a confirmation email is sent. No: a payment-failure notification is sent and the process ends.

Scenario 2: Loan Application Processing

Process description

A customer applies for a personal loan at a bank. The process starts when the customer submits a loan application. The bank's system verifies the applicant's documents and credit score. If the documents are incomplete or invalid, the application is rejected, the customer is notified, and the process ends. If the documents are valid, the system checks the applicant's eligibility based on credit score and income. If the applicant is not eligible, a rejection notification is sent and the process ends. If the applicant is eligible, the request is forwarded to the loan officer for final approval. If the loan officer approves the loan, the system disburses the loan amount and sends an approval notification. If the loan officer rejects the loan, a rejection notification is sent instead. The process ends once the appropriate notification has been sent.

Elements used

1 Start Event: Customer submits loan application.

- Verify Documents & Credit Score.
- Check Eligibility (Credit Score & Income).
- Forward to Loan Officer for Approval.
- Disburse Loan Amount & Send Approval Notification.
- Reject Application & Notify Customer.
- Send Rejection Notification (Not Eligible).
- Send Rejection Notification (Loan Officer Reject).

3 Exclusive Gateways: Documents Valid? | Eligible? | Loan Officer Approves?

3 End Events: Application Rejected (Docs), Application Rejected (Not Eligible), Loan Approved, Loan Rejected.

Each End Event represents one possible outcome of the loan application process.

Gateway logic

- **Documents Valid?** — Valid: the system checks eligibility. Invalid: the application is rejected and the customer is notified, and the process ends.
- **Eligible?** — Eligible: the request is forwarded to the loan officer. Not Eligible: a rejection notification is sent and the process ends.
- **Loan Officer Approves?** — Approve: the loan amount is disbursed and an approval notification is sent. Reject: a rejection notification is sent instead.

Scenario 3: Job Applicant Recruitment Process

Process description

This process models how a company's HR department handles a job application. The process begins when a candidate submits a job application online. The HR system screens the application against the minimum eligibility criteria. If the candidate does not meet the criteria, a rejection notification is sent and the process ends. If the candidate meets the criteria, HR schedules a technical interview, and the technical panel evaluates the candidate's performance. If the candidate fails the technical interview, a rejection notification is sent and the process ends. If the candidate passes, they are scheduled for an HR/managerial round. If the candidate is rejected in the HR round, a rejection notification is sent and the process ends. If the candidate is selected, the system generates an offer letter and sends it to the candidate, after which the process ends.

Elements used

1 Start Event: Candidate submits job application.

- Screen Application vs Eligibility Criteria.
- Schedule Technical Interview.
- Evaluate Technical Interview Performance.
- Schedule HR/Managerial Round.
- Generate & Send Offer Letter.
- Send Rejection Notification (Not Eligible).
- Send Rejection Notification (Technical).
- Send Rejection Notification (HR Round).

3 Exclusive Gateways: Meets Eligibility Criteria? | Passed Technical Interview? | Selected in HR Round?

4 End Events: Rejected (Not Eligible), Rejected (Technical), Rejected (HR Round), Offer Letter Sent. Each End Event represents one possible outcome of the recruitment process.

Gateway logic

- **Meets Eligibility Criteria?** — Yes: the candidate is scheduled for a technical interview. No: a rejection notification is sent and the process ends.
- **Passed Technical Interview?** — Pass: the candidate proceeds to the HR/managerial round. Fail: a rejection notification is sent and the process ends.
- **Selected in HR Round?** — Selected: an offer letter is generated and sent to the candidate. Not Selected: a rejection notification is sent and the process ends.
